The following is an examiner's statement of reasons for allowance:

In regard to the independent claim 1; while, the prior art of record disclose of a sound reproducing apparatus for driving a plurality of speakers with two of the speakers having a distance there-between to reproduce multi-channel sound, the sound reproducing apparatus comprising: a generator configured to generate a measuring signal and supply the measuring signal to each of the plurality of speakers; at least two sensors positionable to a listening position, each of the at least two sensors transmitting a reception notification when receiving a measuring sound wave radiated from each of the speakers in accordance with the measuring signal; a time difference measuring unit configured to measure a time difference between a time instant when the measuring signal is generated and a time instant when the reception notification is received from each of the at least two sensors; a distance calculator configured to calculate a distance between each of the at least two sensors and each of the two speakers based on the measured time difference and a position calculator configured to calculate the position of each of the two speakers based on the calculated distance.

However, none of the art as in combination disclose of such specific wherein the distance calculator configured to calculate a distance between the at least two sensors

Art Unit: 2614

and a distance between each of the at least two sensors and each of the two speakers based on the measured time difference and the known distance between the two speakers; and a position calculator configured to calculate a position of each of the two speakers based on the calculated distance between the at least two sensors and the calculated distance between each of the two speakers from each of the at least two sensors.

Claims 2, 12 have been analyzed and allowed for their dependency on the allowable claim 1 as noted above.

Similarly Re claim 11, while the prior art of record disclose of the specific wherein a method of identifying a position of each of a plurality of speakers using at least two sensors disposed in a listening position, the method comprising the steps of: supplying the measuring signal in turn to two of the plurality of speakers having a known distance from each other; transmitting a reception notification when each of the at least two sensors receives a measuring sound wave radiated from each of the two speakers in accordance with the measuring signal; measuring a time difference between a time instant when the measuring signal is generated and a time instant when the reception notification is received from each of the at least two sensors for each of the two speakers and calculating a distance between each of the at least two sensors and each of the two speakers based on the measured time difference and a position calculator

Art Unit: 2614

configured to calculate the position of each of the two speakers based on the calculated distance.

However, none of the prior art of record disclose of the specific wherein calculating a distance between the at least two sensors and a distance between each of the two sensors and each of the two speakers based on the measured time difference and the known distance between the two speakers; and calculating positions of the at least two sensors relative to the two speakers based on the calculated distance between the at least two sensors and the calculated distance between each of the two speakers and each of the at least two sensors; calculating a position of each of the other of the plurality of speakers based on the calculated positions of the at least two sensors relative to the two speakers.

Claim 14 has been analyzed and allowed for their dependency on the allowable claim 11 as noted above.
